                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  308,
                                                                                                                                                                                                                                                                                                                                                                                                                               was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNA92 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XI10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                     Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                           was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi 4732114 | gb | AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /lab_host="E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /lab host="E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Laboratory Mouse DNA Resources/documents/dnares/). The DNA (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA polymuclectide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The ligated to the blunt ends in high molar excess. The electrophored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a 3' PCR primer, used with the 5' primer given in AAF30373, to amplify a cDNA fragment corresponding to nucleotides 1214-1902 of the human chfr sequence given in AAF30352. The chfr gene encodes the human mitotic checkpoint protein Chfr (see AAE20219), which is required for regulation of the transition of Cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SM480, DLD1, HT29, HCT116, SAOS2, U2OS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of U2OS cells. Chfr polyapptides and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which cardinates addition to addi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The CC chfr gene encodes the human mitotic checkpoint protein Chfr (see CC AAB20219), which is required for regulation of the transition of cells (from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to cmitotic stress. A set of primers (see AAF3033-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, U2OS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of U2OS cells. Chfr polypeptides and chfr mucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more constituted to additional antitumour therapies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                              CC given in AAF30363, to amplify a cDNA fragment corresponding to comucleotides 904-1902 of the human chfr sequence given in AAF30352. The chiral gene encodes the human mitotic checkpoint protein Chfr (see CC AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is CC associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine CC whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, UZOS, IWRS and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr polypeptides and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more constituted to additional antitumour therapies

Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, diagnosing tumorigenic cells and in screening for anticancer drugs. for

ω --Page 38; 85pp; English

The present sequence is that of a 3' given in AAF30365, to amplify a cDNA nucleotides 1187-1753 of the human ch the human chfr sequence PCR primer, used with the 5' fragment corresponding to given primer The

```
chfr gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines $M8480, DLD1, HT29, HCT116, SAOS2, UZOS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr polypeptides and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more
sensitive to additional antitumour therapies

Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, diagnosing tumorigenic cells and in screening for anticancer drugs.

Example 3; Page 38; 85pp; English

The present sequence is that of a 3' PCR primer, used with the 5' primer given in AAF30369, to amplify a cDNA fragment corresponding to nucleotides 1215-1753 of the human chfr sequence given in AAF30352. The chfr gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, U2OS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr

                                                                                                                                                                                                                                                                                                                                The present sequence is that of a 3' PCR primer, used with the 5' primer CC given in AAF30371, to amplify a cDNA fragment corresponding to nucleotides 1215-1772 of the human chfr sequence given in AAF30352. The Chir gene encodes the human mitotic checkpoint protein Chfr (see CC AAB20219), which is required for regulation of the transition of Cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to comitotic stress. A set of primers (see AAF3033-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, UZOS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr polypeptides and chfr mucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more sensitive to additional antitumour therapies
                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                    멼
                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a 3' PCR primer, used with the 5' primer CC given in AAF30367, to amplify a cDNA fragment corresponding to nucleotides 1187-1772 of the human chfr sequence given in AAF30352. The CC incleotides 1187-1772 of the human mitotic checkpoint protein Chfr (see CL fir gene encodes the human mitotic checkpoint protein Chfr (see CL from prophase to metaphase during mitosis. Loss of expression of Chfr is CC associated with a predisposition to tumourigenesis upon exposure to CC mitotic stress. A set of primers (see AAF30353-76) was used to amplify CC regions spanning the entire chfr coding region in order to determine CC whether the chfr gene is mutated in any of the human cancer cell lines CC sw480, DLD1, HT29, HCT116, SAOS2, UZOS, IMR5 and NGP. A mutation leading CC to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr properties and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more

                                                                                                                                                                                                                                                                                                                                                                   á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The present invention describes an isolated nucleic acid (I) coding for a CC dominant negative, mutant RAB7 polypeptide and/or a dominant negative, mutant RAB7 polypeptide and/or a dominant negative, cc mutant ARHGEF10 polypeptide. (I) contains in comparison to the wild type RAB7 encoding sequence comprising 624 bp (SEQ ID NO: 1, AD125025) and/or CC to the wild type ARHGEF10 encoding sequence comprising 3366 bp (SEQ ID CC NO: 3, AD125027), one or more mutations, where the presence of the CC nucleic acids is indicative for a predisposition or presence of a CC peripheral neuropathy. Also described: (1) a nucleic acid probe which is CC a fragment of (I); (2) a recombinant vector comprising (I); (3) a host CC at fragment of a diagnostic assay to detect the presence of a peripheral neuropathy in a human; and (5) a transgenic non-human animal comprising CC the vector of (2). (I) is useful for isolating and detecting human CC peripheral neuropathy causing or predisposing genes. The diagnostic assay is useful for detecting the presence of peripheral neuropathy in a human. CC The present sequence represents a PCR primer for human ABFB1, which is
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc given in AAF30376, to amplify a cDNA fragment corresponding to comclectides 1625-2279 of the human chir sequence given in AAF30352. The chir gene encodes the human mitotic checkpoint protein Chfr (see CAAB20219), which is required for regulation of the transition of cells (from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to complicity regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines CC whether the chfr prince cid substitution was identified in the chfr gene of U2OS cells. Chfr polypeptides and chfr nucleic acids are used in the chfr gene of U2OS cells. Chfr polypeptides and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more constitute to additional antitumour therapies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The antisense compound is useful for inhibiting the expression of phosphorylase kinase alpha-2 in human cells or tissues, and for treating a human having a disease or condition associated with phosphorylase kinase alpha-2 including metabolic disorder or diabetes. The antisense compound is useful for diagnostics, therapeutics, prophylactically to prevent or delay infection, inflammation or tumour formation. The antisense compound is safely and effectively administered to humans. The present sequence is an antisense oliponucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel drug composition containing a substance active in inhibiting the binding of the hepatocyte growth factor (HGF) receptor c-Met to c-Met regulatory mucin (Mermuc) and in doing so regulates HGF-dependent cell proliferation and tissue, organ, blood vessel, mucous membrane, bone and nerve formation, repair, regeneration and neogenesis. The novel drug composition has the following activities: hepatotropic, nephrotropic, antiarteriosclerotic, antiinflammatory, and virucide. The drug composition is useful for the treatment and prevention of diseases of the liver (including hepatic sclerosis, hepatic fibrosis, and symptomatic, acute or viral hepatitis), kidney (including chronic kidney disease) and lung, and arteriosclerosis. This polynucleotide sequence represents the DNA encoding an HGF receptor of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drug composition containing regulator of binding of HGF receptor a regulatory mucin for treatment and prevention of liver, kidney disease by regulation of cell proliferation and tissue formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13-DEC-2001; 2001JP-00380158

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a purified nucleic acid sequence (referred as CACNA2D2 gene which encodes human calcium channel alpha2delta-2 subunit CC protein) comprising a fully defined alpha2delta splice isoform 1, 2 or 3 cc nucleic acid sequence, or its complement and the encoded protein which C include are: (1) a method of producing a calcium channel protein which C involves introducing a recombinant expression vector comprising the CC CACNA2D2 nucleic acids and encoding the calcium channel protein, into a cultured host cell under conditions such that the host cell expresses the CC amino acid sequences; and (2) a method for co-expressing calcium channel proteins, comprising carrying out the method of (1), but with one or more cc producing a calcium channel protein acid sequences and comprising one or more nucleic acid sequences cc producing the splice variants. CACNA2D2 nucleic acid is useful for protein activity (e.g. epilepsy migraine, episodic ataxia, cancer, stroke, brain trauma, Alzheimer's disease, multiinfarct dementia, cancer, stroke, brain trauma, angenesia, cardiac arritythmia, angina cancer, stroke, brain trauma, angenesia, cardiac arritythmia, angina cancer, stroke, st

CC subunit splice isoform 1, splice isoform 2 sequence or splice isoform 3, or their variants, and their encoding nucleic acids (or their variants, and their encoding nucleic acids (or their variants, and their encoding nucleic acids (or their compound for modulating calcium channel activity, an antibody which binds compound for modulating calcium channel activity, an antibody which binds chuman animal (where the animal expresses a reduced level of calcium channel alpha 2delta subunit relative to a corresponding wild-type canimal. The calcium channel proteins are useful for generating an cantibody (which is useful for detecting the proteins or their portions). The transgenic animal (preferably a rodent e.g. mouse) is useful for calcium channel proteins are useful for generating an cantibody (which is useful for detecting the proteins or their portions). The carting a therapeutic compound for treating a transgenic animal cantibody (which is useful for detecting the proteins or their portions). The having cancer, especially lung cancer (small call carcinoma or non-small cancer, especially carciant (small call carcinoma or non-small cancer, cell carcinoma or non-small cancer, campotrophic lateral sclerosis, convulsions, seizures, Huntington's tracke, brain trauma, Alaheimer's disease, multiinfarct dementia, convulsions, seizures, Huntington's convulsions, seizures, Huntington's carchythmia, angina pectoris, hypoxic damage to the cardiovascular system, and congestive heart failure, or Lambert-Eaton mysachenic syndrome. The calcium channel alpha2delta subunit gene for the calcium channel alpha2delta subunit gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New substantially pure human calcium channel alpha2delta subunit splice isoform 1, 2 and 3 sequence useful in preventing, treating and diagnosing cancer, neurological disorders and cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          amyotrophic lateral sclerosis; convulsions; Huntington's disease; amnesia; cardiovascular disease; cardiac arrhythmia; angina pectoris; hypoxic damage; ischaemia; myocardial infarction; SSCP; congestive heart failure; Lambert-Baton myasthenic syndrome; single strand conformation polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transgenic; cancer; lung cancer; small cell carcinoma; epilepsy; s

                                                                                                                                                                                                                                                                                                           The sequence represents the Afx transcription factor response element, selected sequence #12. Human fork head transcription factor, Afx, was expressed and the protein used to select a response element comprising an base pair (bp) nucleotide sequence. The nucleotide sequence comprises AACATGTT, the Afx response element, and is useful in bioinformatic analysis e.g. of the human genome. Employing the Afx response element is also useful for screening for genes that may be used as diabetes drug targets. This can provide a subset of genes transcriptionally responsive to insulin and may lead to development of assays that facilitate the analysis of genes interacting with the insulin receptor pathway. The genes found in such screening may also be employed in further screening methods for compounds which modify the insulin receptor signalling
                                                                                                                                                                                                                                   Sequence 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Afx response element with a nucleotide sequence comprising a DNA binding site for the human fork head transcription factor Afx, useful screening for genes or in bioinformatic analysis of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-218446/22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-AUG-1999;

                                                                           The invention discloses a microarray comprising a plurality of nucleic CC acid probes including one of 2,018,500 fully defined sequences, or its comperfect match, perfect mismatch, antisense match or antisense mismatch. CC Also disclosed is a method of gene expression analysis. The array is used CC in monitoring gene expression levels by hybridisation to a DNA library, CC in analysis of genetic variation or in hybridisation to a DNA library, CC in analysis of genetic variation or in hybridisation to a DNA library, CC in analysis one target sequence. The method of analysis comprises CC hybridising at least one or more nucleic acids to at least two or more cC nucleic acid probes and detecting the hybridisation. The nucleic acid grobes are attached to a solid support. The analysis comprises monitoring CC gene expression levels, identifying biallelic markers or polymorphisms, CC or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotolot hybridisation to identify or detect the sequence or specific cutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones CC for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence CC data for this patent can also be obtained in electronic format directly cx

                                                                                                                                                                                                                                                                                                                      CC complementary to particular genes, and can be used as probes for a CC complementary to particular genes, and can be used as probes for a CC variety of analyses such as gene expression analysis. Each probe CC comprises 9 or more consecutive nucleotides from at least one of 14936 CC nucleotide sequences defined in the patent, or their perfect sense match, antisense match or antisense mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct CC nucleic acid probes. The array is useful in monitoring gene expression CC levels by hybridisation to a DNA library, in analysing genetic variations, and in hybridising tag-labelled compounds. The probes are useful for identifying family members of a gene. The probes are also cuseful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, CC that have been previously isolated and sequenced, in Southern, northern, CC mapping the 5' termini of mRNA molecules by primer extensions. The nucleic acid sequences of the invention are also useful as PCR primers. CC complementary to particular genes with a wide range of analytical uses. CC complementary to particular genes with a wide range of analytical uses. CC The sequence data for this patent was obtained in electronic format cromat directly from the USPTO web site at segdata.uspto.gov/psipsDIDEntry.html

The present invention describes a novel enzymatic nucleic acid (ENA) CC having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues (; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least 5 cc can inhibit collagenase and stromelysin production in the synovial CC membrane of joints for the treatment or prevention of arthritis, can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for creating graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of cromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The present sequence is used in the exemplification of the present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20-APR-1995;

The present invention describes a novel enzymatic nucleic acid (ENA) Chaving a hammerhead motif (HM) comprising: (i) at least 5 ribose residues (; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's C can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, can also be used to treat antigen presenting calls of a donor to induce tolerance in a recipient to an alloantigen presenting autoimmune disease, and for C treating altergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of C stromelysin without introducing the non-specific effects upon gene cappression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment C I lower than that required of antisense molecules, and is highly considered. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                          13-DEC-1994

          The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-C-methyl modifications; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 15 BP; 5

The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               27-JUN-2000;

                                                                                                                                                                                                                                                                                    Fluorescently-labeled nucleic acid probes for assaying nucleic acids their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                             Example 41;

                                                                                                                                                                                                                                                                                                                                             oligonucleotides are useful for treating diseases or disorders associated with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder or ischaemia/reperfusion injury. The antisense oligonucleotides are also useful for research and diagnostics. The present sequence is that of an antisense 2.0-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone, a central "gap" region of ten nucleotides flanked by five nucleotide 2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.400 (2.4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense compounds, especially oligonuclectides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antisense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, neuroprotective, disorder and vasotropic activity. The antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oligonucleotides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonuclectides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modulate expression; immunomodulator; antidiabetic; cardiovascular; cardiant; neuroprotective; vasotropic; ischaemia; reperfusion injury;

                                                                                                                                                                                                                                                                      gequences of the invention contain numerous binding sites for members of the HMG-I(Y) ("high mobility group") family of nonhistone chromatin corrections, a group of minor groove-binding architectural transcription factors which are thought to be involved in the mechanisms by which EASE sequences improve expression of transgenes. The EASEs of the invention can also be used in the identification of additional EASE sequences (e.g. from other, transformed cell lines which exhibit high levels of expression not attributable to a high gene copy number). Expression of recombinant therapeutic proteins in mammalian cells is often preferable to expression in microbial (prokaryotic) cells, since the post-translational modifications found in mammalian cells are more likely to resemble those found in a mammal. Sequences AAX98348 - AAX98353 represent PCR primers used to create electrophoretic mobility shift assay (EMSA) probes

                                                                                                                                                                                                                                                                                                                                                                                                                                           polynucleotide, and production of a recombinant protein which comprises culturing the cell under conditions promoting expression of the protein. The polynucleotides are used for production of recombinant protein, particularly in eukaryotic cells for research and therapeutic applications. The method is also used for identifying expression augmenting sequence elements e.g. from other transformed cell lines. High expression of recombinant proteins is facilitated in a short period. The present sequence is an EMSA (electrophoretic shift mobility assay) probe for the hamster HMG-I(Y) protein.
                               ADM36243
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated polynucleotide comprising a nucleic acid molecule comprising nucleotides 11538-11692, nucleotides 11538-11760, nucleotides 11673-12165, nucleotides 11813-12165 or nucleotides 11899-12165 of ADD89798, the hamster high mobility group, HMG-I(Y) gene, fragments of the DNA having expression augmenting activity (an expression augmenting sequence element, EASE) or their combinations or complementary DNA. Also included are a mammalian host cell which comprises the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expression augmenting sequence element; EASE; EMSA; electrophoretic shift mobility assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13-JAN-1997; 97US-00785150.

Specifically, it refers to the isolated nucleic acid molecules encoding all or part of these proteins, appropriate antibodies and screening assays useful for the development of drug compositions derived thereof. The present invention describes these compositions as useful for the treatment of diseases associated with abnormalities of adipocyte function, such that they can be used to prevent, treat or diagnose obesity, hypertension, hyperlipaemia, diabetes and arteriosclerosis. Accordingly, they exhibit anorectic, antidiabetic, antiarteriosclerosic, antilipaemic and hypotensive activities. This oligonucleotide is a 3' RACE gene specific PCR primer used to amplify murine adipocyte-derived cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR; 88; obesity;

                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary disease such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a double-stranded short interfering nucleic (siNA) molecule that down-regulates expression of an endogenous mamma target gene comprising one or more chemical modifications and each st of the double-stranded siNA comprises about 21 nucleotides. The siNA the invention demonstrates antiarteriosclerotic, neuroprotective, neuroprotective, antiparkingonian and anticonvalsant activities and may be

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal gro receptor gene epidermal growth

Example 9 SEQ ID NO 1241; 171pp; English

downregulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The siNAs may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA) double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are The invention relates to short interfering nucleic acids (siNA) which to modulate expression of EGFR genes in tissue explants

This invention relates to novel membrane proteins that are associated with differentiation and/or metabolic function of adipocytes, in particular of mouse origin. Specifically, it refers to the isolated nucleic acid molecules encoding all or part of these proteins, appropriate antibodies and screening assays useful for the development or drug compositions derived thereof. The present invention describes these compositions as useful for the treatment of diseases associated with abnormalities of adipocyte function, such that they can be used to prevent, treat or diagnose obesity, hypertension, hyperlipaemia, diabeter and arteriosclerotic, antilipaemic and hypotensive activities. This oligonucleotide is a 5' RACE gene specific PCR primer used to amplify murine adipocyte-derived cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                             Example 3; SEQ ID NO 37; 195pp; Japanese

The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human HERI (EGFR) mRNA transcript.

              cc library by providing several mRNA, synthesising first and second cDNA cc strands from mRNAs, ligating a first adaptor to the 5' end and a second cc adaptor to the 3' end of the double stranded cDNA to produce an adaptor-cc modified cDNA, cleaving the adaptor-modified cDNA with restriction ce endonuclease Sfil to produce first a nucleic acid and cloning the first nucleic acid into an expression vector. Also described are: a cellular cc library (I) comprising the retrovital vector library produced by (M1), where the first nucleic acid is fused with 5' end of the second nucleic acid; and screening (M2) for a bioactive agent capable of altering a cellular phenotype involving introducing a retrovital expression vector library, produced by (M1) into several cells, screening several cells for a cell with an altered phenotype. (I) is useful for creating novel cell lines from cancer patients, for identifying modulators of immune response, in neurobiology for screening anti-spoptotics for preservation of finance and processing anti-spoptotics for preservation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

type B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         agents capable of modulating exocytosis. (I) is also useful in conjunction with known cancer therapeutics to screen agonists to make the therapeutics more effective or less toxic. (MI) is useful to identify agents that regulate the intracellular and sarcolemmal calcium cycling in cardiomyocytes, to prevent arrhythmias. (M2) is useful for screening agonists of bone morphogenic proteins, hormone mimetics to stimulate, regulate or enhance new bone formation, and for screening bioactive agents capable of modulating various physiological process or biochemical activities. This sequence represents an adaptor associated with the creation of an expression vector library.
                                                                                                                                                          A CDNA fragment (see AAT10327) coding for the lambda light chain variable region of a human antibody which specifically recognises a lipopolysaccharide (LPS) antigen from Potential actual actual was cloned by PCR. The coding sequence can be used for preparing cell lines which produce monoclonal antibodies against the LPS. The present sequence is that of a 5'-primer used in the PCR amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-JUN-1994;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; immunoglobulin; IgM; lambda light chain; variable region; lipopolysaccharide; LPS; antigen; Pseudomonas aeruginosa; type monoclonal antibody; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18-JUL-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAT10330 standard;
                                                                                                                                                                                                                                                                                                                      Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1996-072335/08

                                        nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary disease such as restenosis, atherosclerosis, Alzheimer's disease or parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-

                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             interfering RNA (sirNA), double-stranded RNA, micro-RNA (mirNA) and short chairpin RNA (sirNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single mucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human HERI (EGFR) mRNA transcript.

       The present invention relates to a diagnostic method for detecting and clidentifying bacterial species that cause infections. The method comprises contacting amplified DNA from a clinical sample with a desired combination of oligonuclectide probe sequences that hybridise under coronal hybridisation conditions with hyper-variable regions situated near the conserved regions of genes encoding topolsomerases, especially cyrlyparE, of bacterial species causing the infections. The invention causing bacteria, and a confidence of infection causing bacteria, and a convention. The combination of oligonuclectide probes and primers of the cinvention. The combination of oligonuclectide probes and primers of the species, such as those causing respiratory tract infections. The primers comprised are useful for amplifying topolsomerase genes especially genes encoding cyrls and parE proteins. The present sequence represents an analysis of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
